DETAILED ACTION

1. This Office action is in response to papers filed on 12/19/2008. Amendments made to the claims and Applicant's remarks have been entered and considered.
2. Claims 1-3 are allowed.

RCE

Continued Examination Under 37 CFR 1.114

3. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/19/2008 has been entered.

Reason for Allowance

4. The independent claim (claim 1) has been narrowed to specify every details of the invention. The claimed invention in the amendment is unique because of following reasons.

The claimed invention in amendment describes in claim 1 such that

(1) a plurality of secured positions disposed on the annular portion in the vicinity of the second end of each of the plurality of deflectable arms,

(2) the plurality of secured positions are configured to be bonded to said magnetic circuit part,

(3) wherein a central vibration position of said suspension and said housing is selectable by selecting one of the plurality of securing planned position and bonding the suspension to the magnetic circuit at the selected secured planned position according to a characteristic of said suspension and according to a weight of said magnetic circuit part.

In general, as one can see in musical instruments, it is well known that, by adjusting holes, weight or air flow is changing, and as a result, resonance frequency is changing. Through searches, the examiner found a few most relevant prior arts. Chung (US 2004/0146175) shows (in Fig. 6B) and discloses a resonance frequency is adjusted by holes. [0090, 0113-0114]. Chung however failed to teach a plurality of secured positions disposed on the annular portion as Chung discloses (in 0116) the hole [c] is located in deflectable arms (52-54) instead of an annular portion (51). Chung further failed to teach the plurality of secured positions (holes) are configured to be bonded to said magnetic circuit part because, as shown by Figs. 9 and 10 in view of Fig. 6B, the hole [c] is believed to locate between casing and magnetic circuit part for elastic suspension.

Saiki et al (US 6208237) shows (in Fig. 3) a plural of holes around an annular portion, but failed all other limitations.

Ando (US 2004/0081331) or Kaneda et al (US 7212647) teaches the resonance frequency can be changed by changing weight or holes but failed all other limitations.

It would have been obvious modification to have a plural of holes on suspension plate for resonance frequency change. However, in general view of ordinary skilled in the art, it would not have been obvious modification to have that the plurality of secured positions are configured to be bonded to said magnetic circuit part. The examiner found no prior arts or reasoning for teaching or suggesting that particular claimed invention.
